This study investigated how the current economic recession (since December 2007) has affected dog and cat relinquishment, adoption, and euthanasia at the Anti-Cruelty Society animal shelter in Chicago, Illinois. The study compared temporal patterns of the investigated statistics before (2000–2007) the start of the current recession with the patterns after the start of the recession (2008–2010). The results showed that once the guardianship (ownership) of a nonhuman animal had been established, the recession did not greatly affect the owner’s decision on relinquishment—except for the relinquishment of senior dogs, which may be associated with increased costs of care. However, an unfavorable economic environment may have reduced adoption of animals. The consequences of a decline in adoptions might be reflected in an increase in the proportion or number of sheltered animals euthanized. This study demonstrated how monitoring changes in temporal patterns in these shelter statistics can help guide animal shelters to better prepare for the current recession.

The current economic recession, which began in December 2007 (National Bureau of Economic Research, 2010), affects our communities in many ways.
Companion nonhuman animals, who share a close relationship with humans, are inevitably affected by the recession (Patronek, Beck, & Glickman, 1997; Scarlett, 2008). Although many studies have investigated risk factors for dog and cat relinquishment and factors affecting the success of animal adoption (DiGiacomo, Arluke, & Patronek, 1998; Marston & Bennett, 2003; New et al., 2000; Olson & Moulton, 1993; Patronek, Glickman, Beck, & McCabe, 1996; Patronek, Glickman, Beck, McCabe, & Ecker, 1996; Posage, Bartlett, & Thomas, 1998), the latest study was conducted more than 10 years ago. The economic environment of recession might substantially alter risk factor patterns and their relationships to companion animal overpopulation. More directly, the recession might also reduce the already limited resources for fighting the surplus of companion animals. How animal shelters and nonprofit animal protection organizations prepare for this recession is vital. This adverse economic environment provides researchers with a unique opportunity to address these important issues.

In this study, we focused on how the current recession affects the dynamics of animal intake (such as relinquishment) and disposal (such as adoption and euthanasia) at the Anti-Cruelty Society’s (ACS) animal shelter in Chicago, Illinois. Specifically, the study was carried out to test the following hypotheses:

1. The numbers of dogs and cats relinquished will increase during the recession period (after 2007).
2. The numbers and proportions of dogs and cats adopted among sheltered animals will decrease during the recession period.
3. The numbers and proportions of dogs and cats euthanized at the participating shelter will increase during the recession period.
4. The economic recession will affect dogs more than cats.

MATERIALS AND METHODS

This study was conducted at the animal shelter of the ACS in Chicago, Illinois. The ACS animal shelter is one of the largest shelters serving the Chicago metropolitan area and the surrounding neighborhoods in northern Illinois. Because the ACS has been keeping electronic records of all animals brought in and/or housed at the shelter since 1991, this allows the researcher to evaluate the long-term temporal patterns in animal relinquishment, adoption, and euthanasia. In this study, we reviewed and analyzed the ACS shelter records on dog and cat intake and disposal between 2000 and 2010. In particular, we assessed the impact of the current economic recession by comparing the temporal patterns in these measures before and after the start of the recession. In order to include 2010 data in the analysis, only the records between January 1 and September 15 for the 11 years of investigation were evaluated. Holt’s exponential smoothing

method was used to estimate the predicted values (and their 95% confidence limits [CL]) for years 2008 to 2010 (defined as the recession period) by using the data from the prerecession period (2000 to 2007). The observed values during the recession were then compared with these predicted values and their 95% CL. In the ACS database, the age of the animal was classified into the following groups: (a) kitten or puppy (less than 6 months old), (b) adults (from 6 months to less than 8 years old), and (c) seniors (8 years or older).

In order to further investigate the impact of the recession, we compared the temporal patterns in reporting cost, moving or foreclosure of home, or illness of the animal as the primary reason for relinquishment before and after the start of the recession. These reasons were believed to be dependent on the caregiver’s (owner’s) financial status. The information on reporting the primary reason for relinquishment was collected in free text at the ACS shelter. Table 1 summarizes the keywords used to define the primary reason for relinquishment as cost, moving or foreclosure of home, and illness of the animal.

RESULTS

The projection using the ACS shelter data during the prerecession period (2000 to 2007) showed a steadily decreasing trend in the numbers of puppies and adult dogs relinquished, whereas the projected number of animals relinquished stayed constant across the years for all age categories of cats and senior dogs (Figure 1a, 1b). After comparing the observed data with the projected trend, the number of senior dogs relinquished showed a significant increase in 2009 and 2010 (Figure 1a). The observed numbers of puppies and adult dogs relinquished were also greater than the predicted values during the recession period, although the differences did not surpass the upper 95% CL. Opposite results were observed in the numbers of kittens and adult cats relinquished in 2010, which were lower than the projected values (Figure 1b). After further investigations on whether

The dashed lines are the predicted values estimated by the data from 2000 to 2007 using Holt’s exponential smoothing method. “+” indicates the observed value is above the 95% upper limit for the predicted value and “*” indicates the observed value is below the 95% lower limit for the predicted value. Puppy or Kitten: less than 6 months old; Adult: from 6 months to less than 8 years old; Senior: 8 years or older.

there was a change in the patterns of reporting cost, moving or foreclosure of home, or illness as the primary reason for relinquishment before and after the start of the recession, cost was the only one showing a significant difference from the predicted values (Figure 2).

Temporal patterns in the numbers of senior dogs, kittens, and adult cats adopted showed significant differences before and after the start of the recession (Figure 3a, 3b). A more consistent decrease was observed in the adoption of

The dashed lines are the predicted values estimated by the data from 2000 to 2007 using Holt’s exponential smoothing method. “+” indicates the observed value is above the 95% upper limit for the predicted value.

To our knowledge, this is the first study to scientifically investigate the impact of a recession on companion animal (canine and feline) relinquishment, adoption,

and euthanasia. However, the study data were collected from only one animal shelter (the ACS shelter) serving mainly the metropolitan area of Chicago, Illinois, a region that includes other shelters. Therefore, the results from this study might only be representative of the participating animal shelter. Nonetheless, this study presented a simple method to investigate how the current recession affects
those commonly collected shelter statistics. One necessary assumption applied, while making such inferences by comparing the temporal patterns before and after the start of the recession, is that the current recession was the only factor that differed between these two time periods.

Our findings suggest that once the ownership of a nonhuman animal has been established, the recent economic recession does not affect cat owners’ decisions on relinquishing the animal. The data showed that the number of cats relinquished after the start of the recession did not differ from the prerecession period, excepting a decrease in kittens and adult cats relinquished in 2010. Opposite to the temporal patterns observed in the number of cats relinquished, the number of senior dogs relinquished during the recession was greater than the projected trend using the prerecession data.

The dashed lines are the predicted values estimated by the data from 2000 to 2007 using Holt’s exponential smoothing method. “+” indicates the observed value is above the 95% upper limit for the predicted value and “*” indicates the observed value is below the 95% lower limit for the predicted value. Puppy or kitten: less than 6 months old; Adult: from 6 months to less than 8 years old; Senior: 8 years or older. (continued on following page)

To further study how the recession has affected relinquishment, we investigated the primary reasons for relinquishment, which were believed to be associated with the owner’s financial status. Cost was the only factor among the three investigated primary reasons for relinquishment that showed a significant increase from the projected trend using the prerecession data. In addition, the
increase in reporting cost as the primary reason for relinquishment was observed more consistently among dog owners than in cat owners.

The shelter records also suggest that an unfavorable economic environment may discourage people from adopting animals. We investigated both the number and proportion of animals adopted in this study. Although the number of animals adopted might reflect more closely the demands of the community, this measure depends heavily on the number of animals relinquished. Combining the findings of the trends in the numbers of animals relinquished and adopted would explain the differences between the findings using absolute numbers and proportions of animals adopted. Greater differences were observed in dog adoptions than in cat adoptions as the number of dogs relinquished to the ACS shelter varied more across the years than did the number of cats relinquished. Despite these differ-
ences, both measures—numbers and proportions of animal adopted—suggested a decrease in animal adoptions during the recession period compared with the prerecession period. The findings also showed that a more consistent decrease in the proportion of animals adopted was observed in dogs than in cats.

The consequences of a decline in animal adoptions might be reflected in an increase in the number and proportion of sheltered animals euthanized in recent years. However, inconsistent findings of the trends in euthanasia indicate that other factors may also contribute to the shelter’s decisions on euthanasia (Rogelberg et al., 2007). The findings that only a very small proportion of senior animals at the shelter have been adopted deserve further discussion. The shelter records revealed that illness of animals could not explain the high proportion of animals euthanized in this age group because the percentage reporting illness of animals as the primary reason for relinquishment ranged from only 4% (in 2010) to 61% (in 2003). In addition, the proportion of those reporting illness of animals as the primary reason for relinquishment did not differ before and after the start of the recession.

These findings together suggest that incentive programs, such as low cost spay/neuter and veterinary care, commonly offered by animal shelters during this difficult time may show greater benefits and effectiveness in promoting animal adoptions (Frank & Carlisle-Frank, 2007; White, Jefferson, & Levy, 2010). Although a longer follow-up is needed to confirm whether the observed direction of temporal trends continues, the findings of a greater and more consistent impact of the current economic recession on dog adoption are not surprising, considering that the cost for having a dog is greater than the cost of having a cat. The results from the investigation of reporting cost as the primary reason for relinquishment further support this argument.

**CONCLUSION**

In summary, the results from this study suggest that the current recession has a greater impact on animal adoption than on relinquishment and consistently affects dogs more than cats. Therefore, promoting adoption may be one of the most important strategies to avoid an increase in euthanizing unwanted animals. However, whether promoting adoptions will alter the number of future relinquishments was not evaluated in this study. Providing assistance to new adopters should be equally important for promoting adoptions to ensure the success of ownership. Because the data were collected from only one animal shelter in a limited geographic area and included only 3 years after the start of the recession, conducting continued monitoring of the trends and getting a representative sample of animal shelters in the United States are crucial. Nonetheless, this study demonstrated how monitoring changes in temporal patterns in these
shelter statistics can help guide animal shelters to better prepare for the current recession.

**ACKNOWLEDGMENTS**

We gratefully acknowledge the financial support of the Morris Animal Foundation (Grant D09MS-803). This project would not have been possible without the help of the Anti-Cruelty Society in Chicago, Illinois. Special thanks to Dr. Robyn Barbiers (President of the Anti-Cruelty Society), Tamra Wagenknecht (Director of Shelter Services), and the staff members who helped with the survey. Finally, we thank Dr. Locksley Messam for his insightful comments.
